A reliable driller's cabin is an essential part of any rig system. In addition to providing a safer place for personnel, the driller's cabin houses the control system and serves as the interface to every tool on the rig. Schlumberger delivers safer, more efficient cabins that withstand the toughest drilling conditions. We frequently upgrade the best driller's cabin design with efficient drives and controls AC technology to consistently exceed industry standards.

Schlumberger driller's cabins come with the PRECISE system. Joysticks and touchscreen monitors are integrated into the chair, enabling the user to control many different drilling functions. From there, the user of the PRECISE system can view the full rig environment through a CCTV video monitoring system. The driller's controls interface to multiple PLCs and a network enclosure, which provides communications to the rest of the control system.

The needs of every contractor are different. Schlumberger collaborates with customers to create a custom-fit solution that is ideal for their specific drilling conditions. We build driller's cabins that maximize drilling efficiency, deliver unparalleled speed, best overall performance, and a safer drilling environment for today's market.

Every Schlumberger driller's cabin includes the PRECISE system, which enables the entire rig to be controlled from a single location.
