VERSAC® modular drilling choke technology
Handles advanced well-control applications with high pressure and temperature ratings

**Pressure:**
5,000 to 15,000 psi [34 to 103 MPa]

**Temperature:**
–20 to 350 degF [–28 to 176 degC]

### Applications
- Managed pressure drilling (MPD)
- Critical pressure control
- Underbalanced drilling (UBD)
- Frac plug drillouts
- Frac flowback
- Well control

### How it improves wells
VERSAC® modular drilling choke technology enables high-end pressure management in a wide range of pressures and temperatures. A modular design enables easy component replacement. The ability to reverse trim significantly improves choke operation life and reduces maintenance costs. The unit has the capacity to easily hot swap the actuator without requiring disassembly of internal components, reducing maintenance time.

### How it works
The VERSAC technology is controlled by a specially designed hydraulically driven worm gear or piston actuator. An axially moving gate engages a stationary seat, which creates an annular orifice that varies in area as the gate moves in and out from the seat.

### Additional information
Two styles of hydraulic actuators are available: a piston-style actuator for use on the 5,000-psi VERSAC technology unit and a worm-gear actuator for use on any VERSAC technology unit. Both styles withstand the full working pressure on the outlet of the choke without failure. Spool length and size can be configured to meet custom applications.

Available in reversible 1½-, 2-, and 3-in trim sizes, the VERSAC technology unit is API rated from –20 degF to 350 degF.

VERSAC technology is designed, manufactured, and monogrammed in accordance with API Specification 6A, API Specification 16C, and Conformité Européenne (CE), as well as NACE MR0175 for H₂S service to material class EE. All nonmetallic wetted elastomers comply with NACE TM0187. Optional certifications include PSL3G, ABS Classification of Drilling Systems (CDS), DNV, and NORSOK Standards Z-015 and D-002.
