¹ We use the procedures established in the Greenhouse Gas Protocol: A Corporate Accounting and Reporting Standard (Revised Edition) to calculate our annual CO₂-e emissions in Schlumberger. As part of that process, we need to apply conversion factors to energy consumption data to derive CO₂-e values. Those conversion factors are taken from the IPCC Third Assessment Report (TAR – 100 year); and IPCC Fourth Assessment Report (AR4 – 100 year).

² We have established norms for consumption per person in North America and we use those norms to calculate estimated consumptions of natural gas, electricity and water at facilities that do not report this data, using applicable employee headcount. For Cameron and for Engineering and Manufacturing facilities in North America, consumption values are directly reported. The headcount-based estimates are used for other office and operational facilities in North America. The norms referred to above were established in 2009 and are reviewed annually and updated when necessary.

³ To convert from per million work hours to per 200,000 work hours, divide by 5

⁴ Hydrocarbon Bulk Fluids Spilled has been restated from liters to barrels. Where available, volumes of hydrocarbon spills are reported using information provided by customers or by third-party spill response contractors. Additionally, when applicable, known volumes of stored liquids may be used to determine spill quantities. Finally, in situations where none of the above procedures are applicable, estimates of spilled volume may be made from measurements in impacted areas.
